MOCKING OUT SERVICES

Inline mock

➤ The first way is to override the service during the unit test, as an **inline mock**

Global mock

➤ The second option to override services would be at a **global level** instead of a unit test level.

A SIMPLE ANGULARJS SERVICE

....

to mock out

```javascript
angular.module('notesApp', [])
    .factory('ItemService', [function() {
        var items = [
            {id: 1, label: 'Mock'}
        ];
        return {
            list: function() {
                return items;
            }
        };
    }])
    .controller('ItemCtrl', ['ItemService',
        function(ItemService) {
            var self = this;
            self.items = ItemService.list();
        }
    ]);
```
